## 2. Body

### 2.1. Introduction

We were to create a Portfolio, for our self this time to showcase some of our assignments and create a page reflecting and representing our self.

I created four pages, Home, About me, My CV and Contact me.

The challenge was to use as little Javascript as possible.

### 2.2. Main section of report

I actually started with the HTML files this time. The reason was to find out what content I would like to have on each page and this would give me some idea as to how I would like to display the information and how I would create my layout for the pages.

After writing a draft I started window-shopping for photos, colours and inspiration for my Pages. I landed on a marine-theme. I love the ocean. It also reflects very well on my mind. See references: The effect of the colour Blue.

This time I will not have to many different colours instead I will have different varieties of the colour blue.

I deliberately chose two similar fonts this time. I know it does not establish a good hierarchy for fonts, but I want the page to have the soothing effects of the colours and therefore not to have fonts that varies too much.

So with theme established I started to create the Design. The Logo not a requirement was created in illustrator just to have something in the logo space.

The navigation will be displayed as inline-elements in header and block in footer. I was planning on a hamburger-menu, but decided to keep my page consistent on all platforms. Every page has a “moodphoto” underneath the header.

I created the images for platforms myself. I saw examples of this on the web and thought it was a good way of displaying the projects without using too many words.

Some of the designs are unfinished I was planning on going back, but the deadline caught up with me. For Contact me page I did not know what to put in before I created it.

Please notice that the description areas in my code for CV are empty. This is because I am planning to create a view more function with descriptions at a later stage.

## 2.3. Conclusion

I need more practice with just about everything, but I feel it was easier this time around than during the last semester project.

I should have spent more time commenting in my code.
